

Why ordering B is imperfect in main_M3_S4_r001

The old M=8 absolute-Spearman cut splits B into 3 + 16 + 1 features.

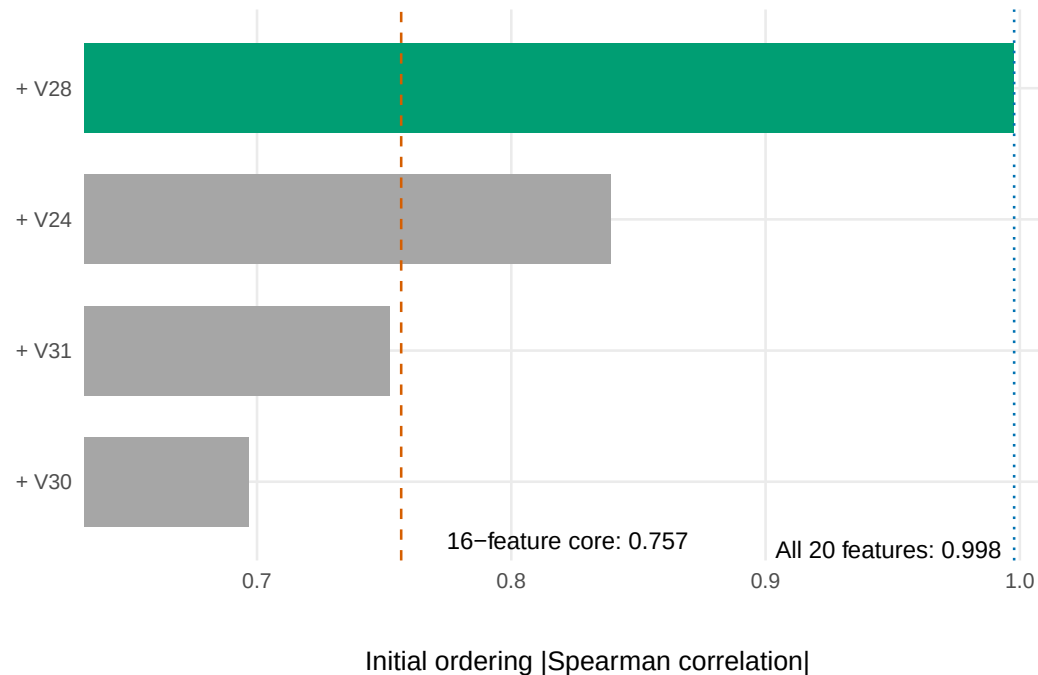

The 16-feature component survives adaptive EB but starts from a folded Isomap ordering.

The M=8 fit preserves its imperfect ordering-B initialization

One excluded trajectory restores the Isomap ordering

Each bar adds one of the four B features excluded from the 16-feature core

The missing trajectory repairs Isomap's geodesic geometry

Correlation between 15-NN graph distance and true latent distance
