

A. True functions on the t scale

Same generating functions as the saved B benchmark

B. Reparameterized functions on the v scale

$g(v) = f(t(v))$; total length $L = 8.839$; $\|g'(v)\| = 1$

C. The curve with equally spaced t markers

11 points: $t = 0, 0.1, \dots, 1$

D. The SAME curve with equal arc-length markers

11 points: $v/L = 0, 0.1, \dots, 1$

E. The coordinate transformation

Dashed line: constant-speed reference $v = L t$

F. Speed before and after reparameterization

Blue: $\|df/dt\|$; orange dashed: $\|dg/dv\| = 1$

Arc length is computed in the selected V13–V14 plane over t in $[0,1]$, using the exact noise-free generating functions. Feature values and the geometric path are unchanged; only position spacing changes. Hollow circles mark the two endpoints. If the horizontal coordinate is normalized to $w = v/L$ in $[0,1]$, then $\|dg/dw\| = L$, not 1.
