

Testing the graph-rule interval [2,4]

One-sweep ELBO selects k=4 | Same observations and MPCurver 0.4.0 controls

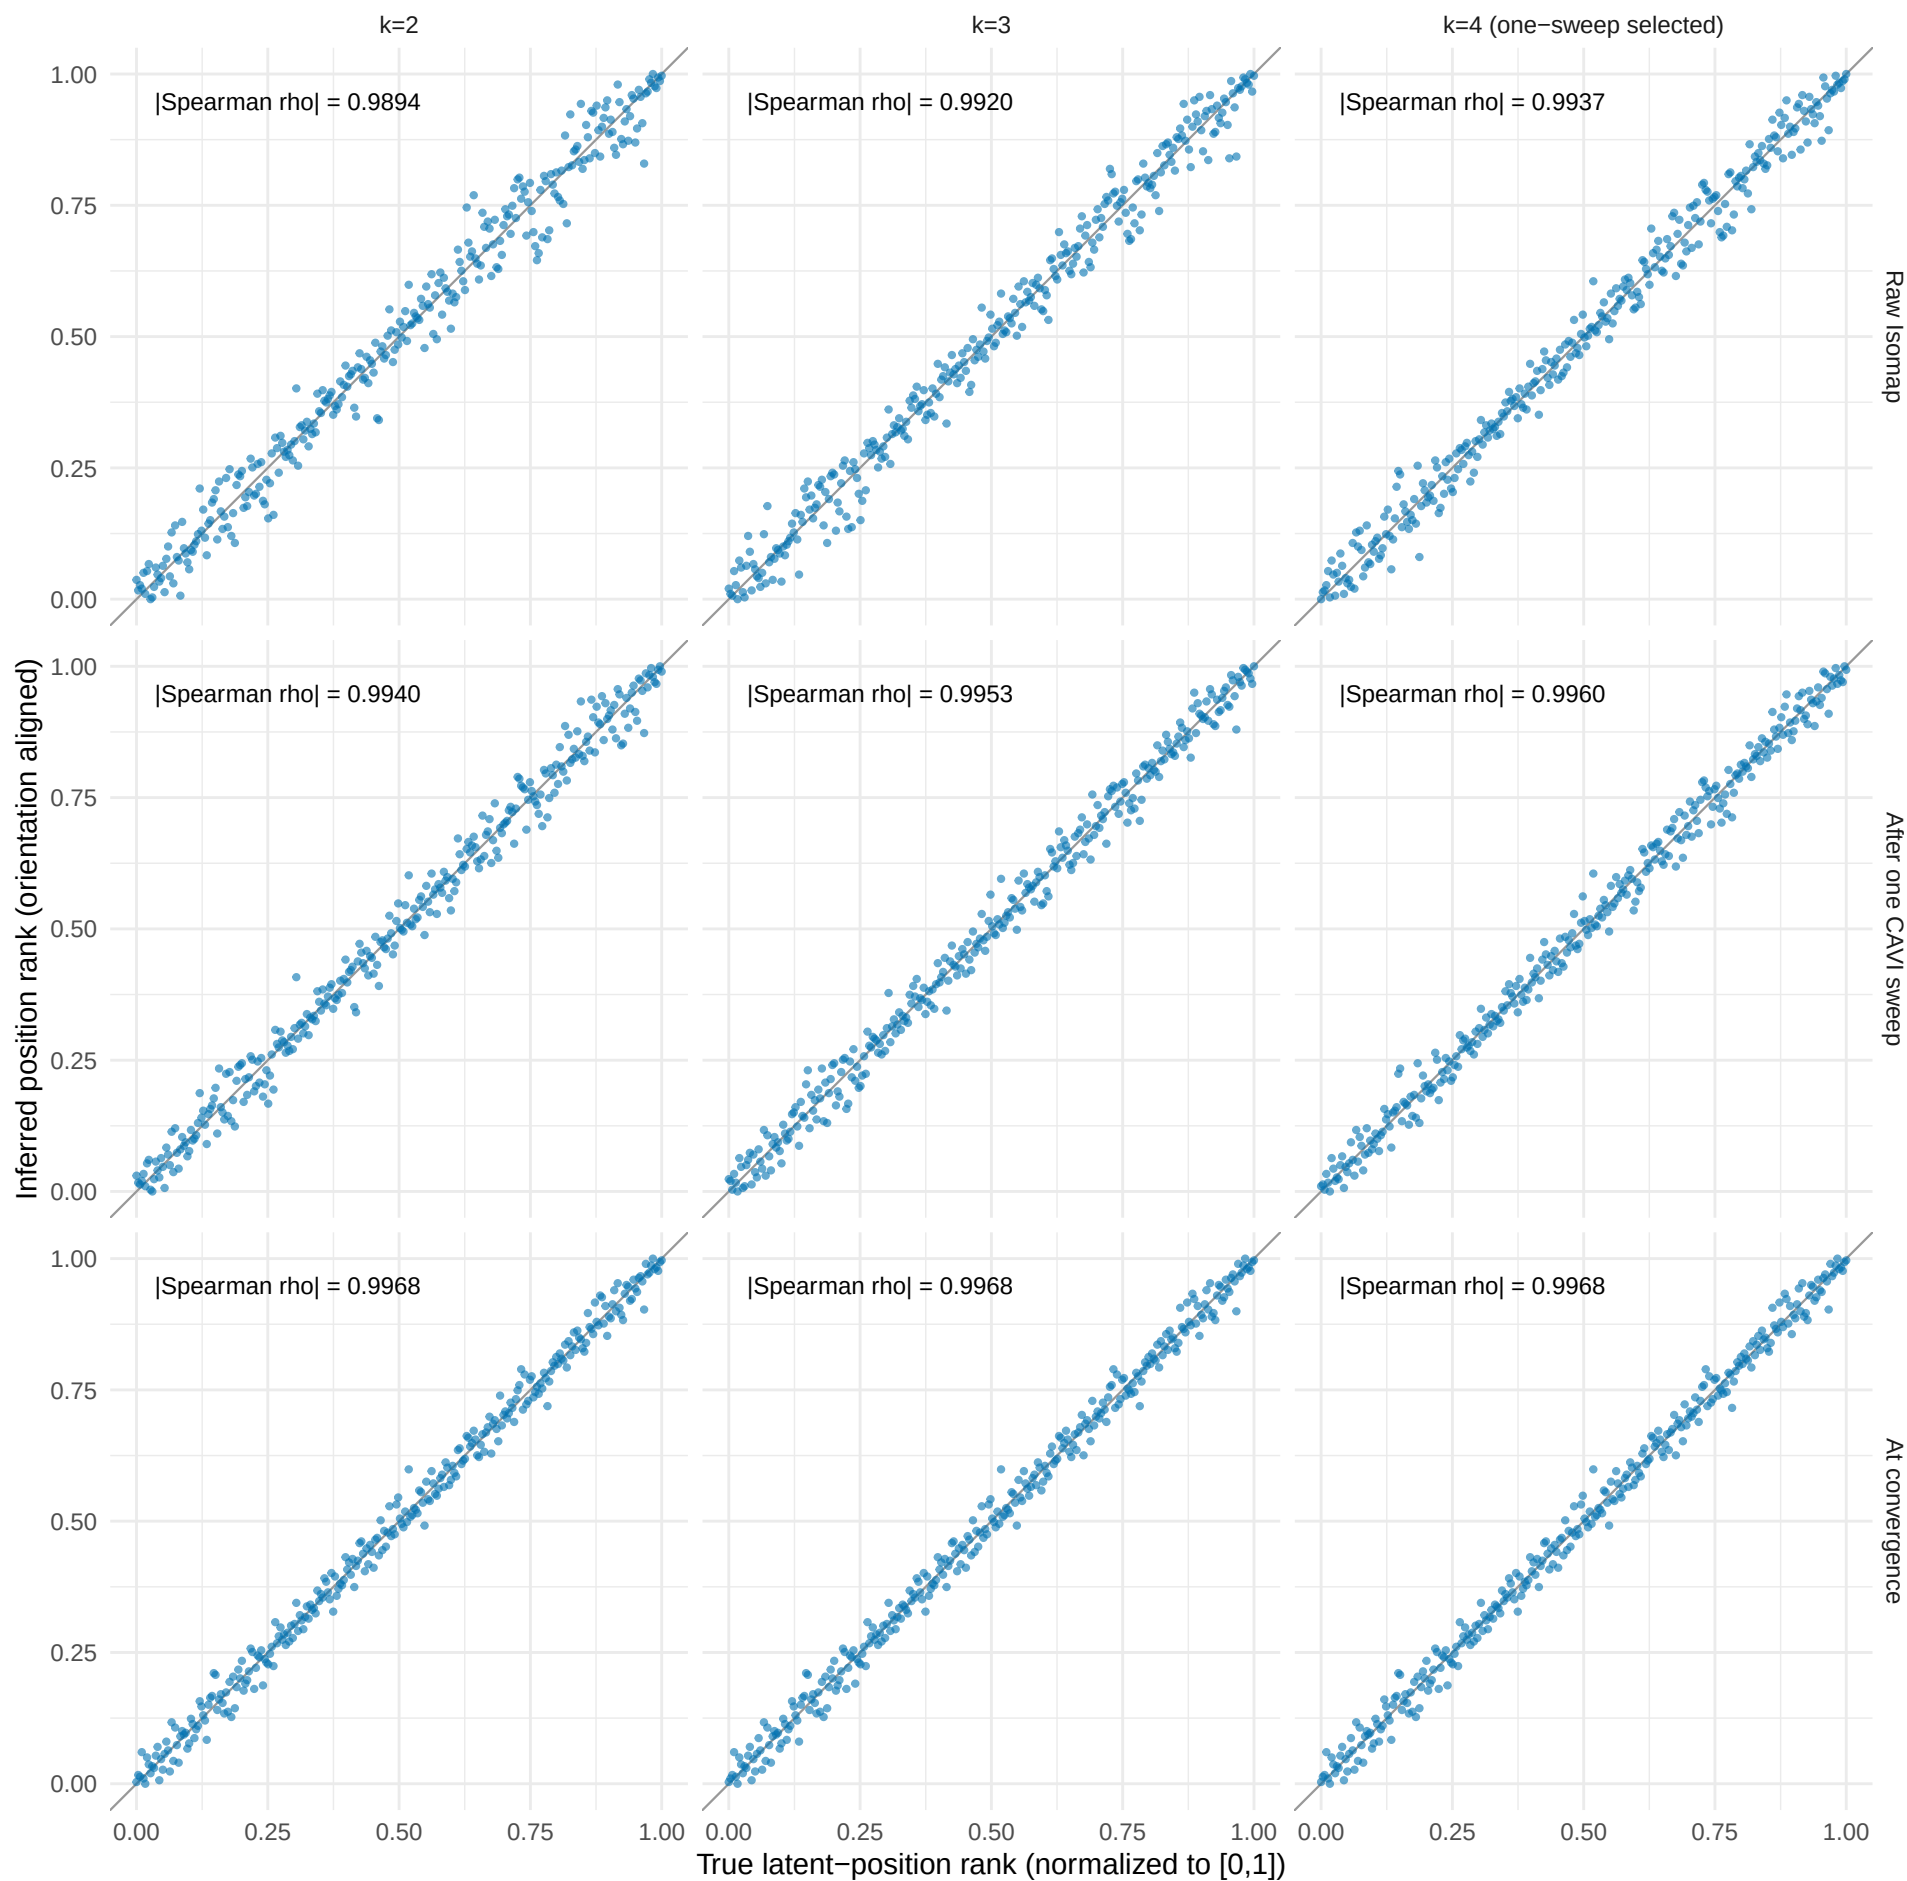

Figure 1. All 300 sample ranks under Isomap k=2,3,4 on the original 12-feature B group. Rows show raw Isomap, one MPCurve CAVI sweep, and continuation to convergence. The column marked selected has the highest one-sweep ELBO within [2,4]. Orientation is aligned using truth for display only; the gray diagonal is perfect rank recovery. All candidates use 50 position bins and identical fitting settings.
