

Can one sweep select an Isomap start that recovers the ordering?

Selected k=10 | Highest converged ELBO: k=7 | MPCurver 0.4.0; 50 position bins

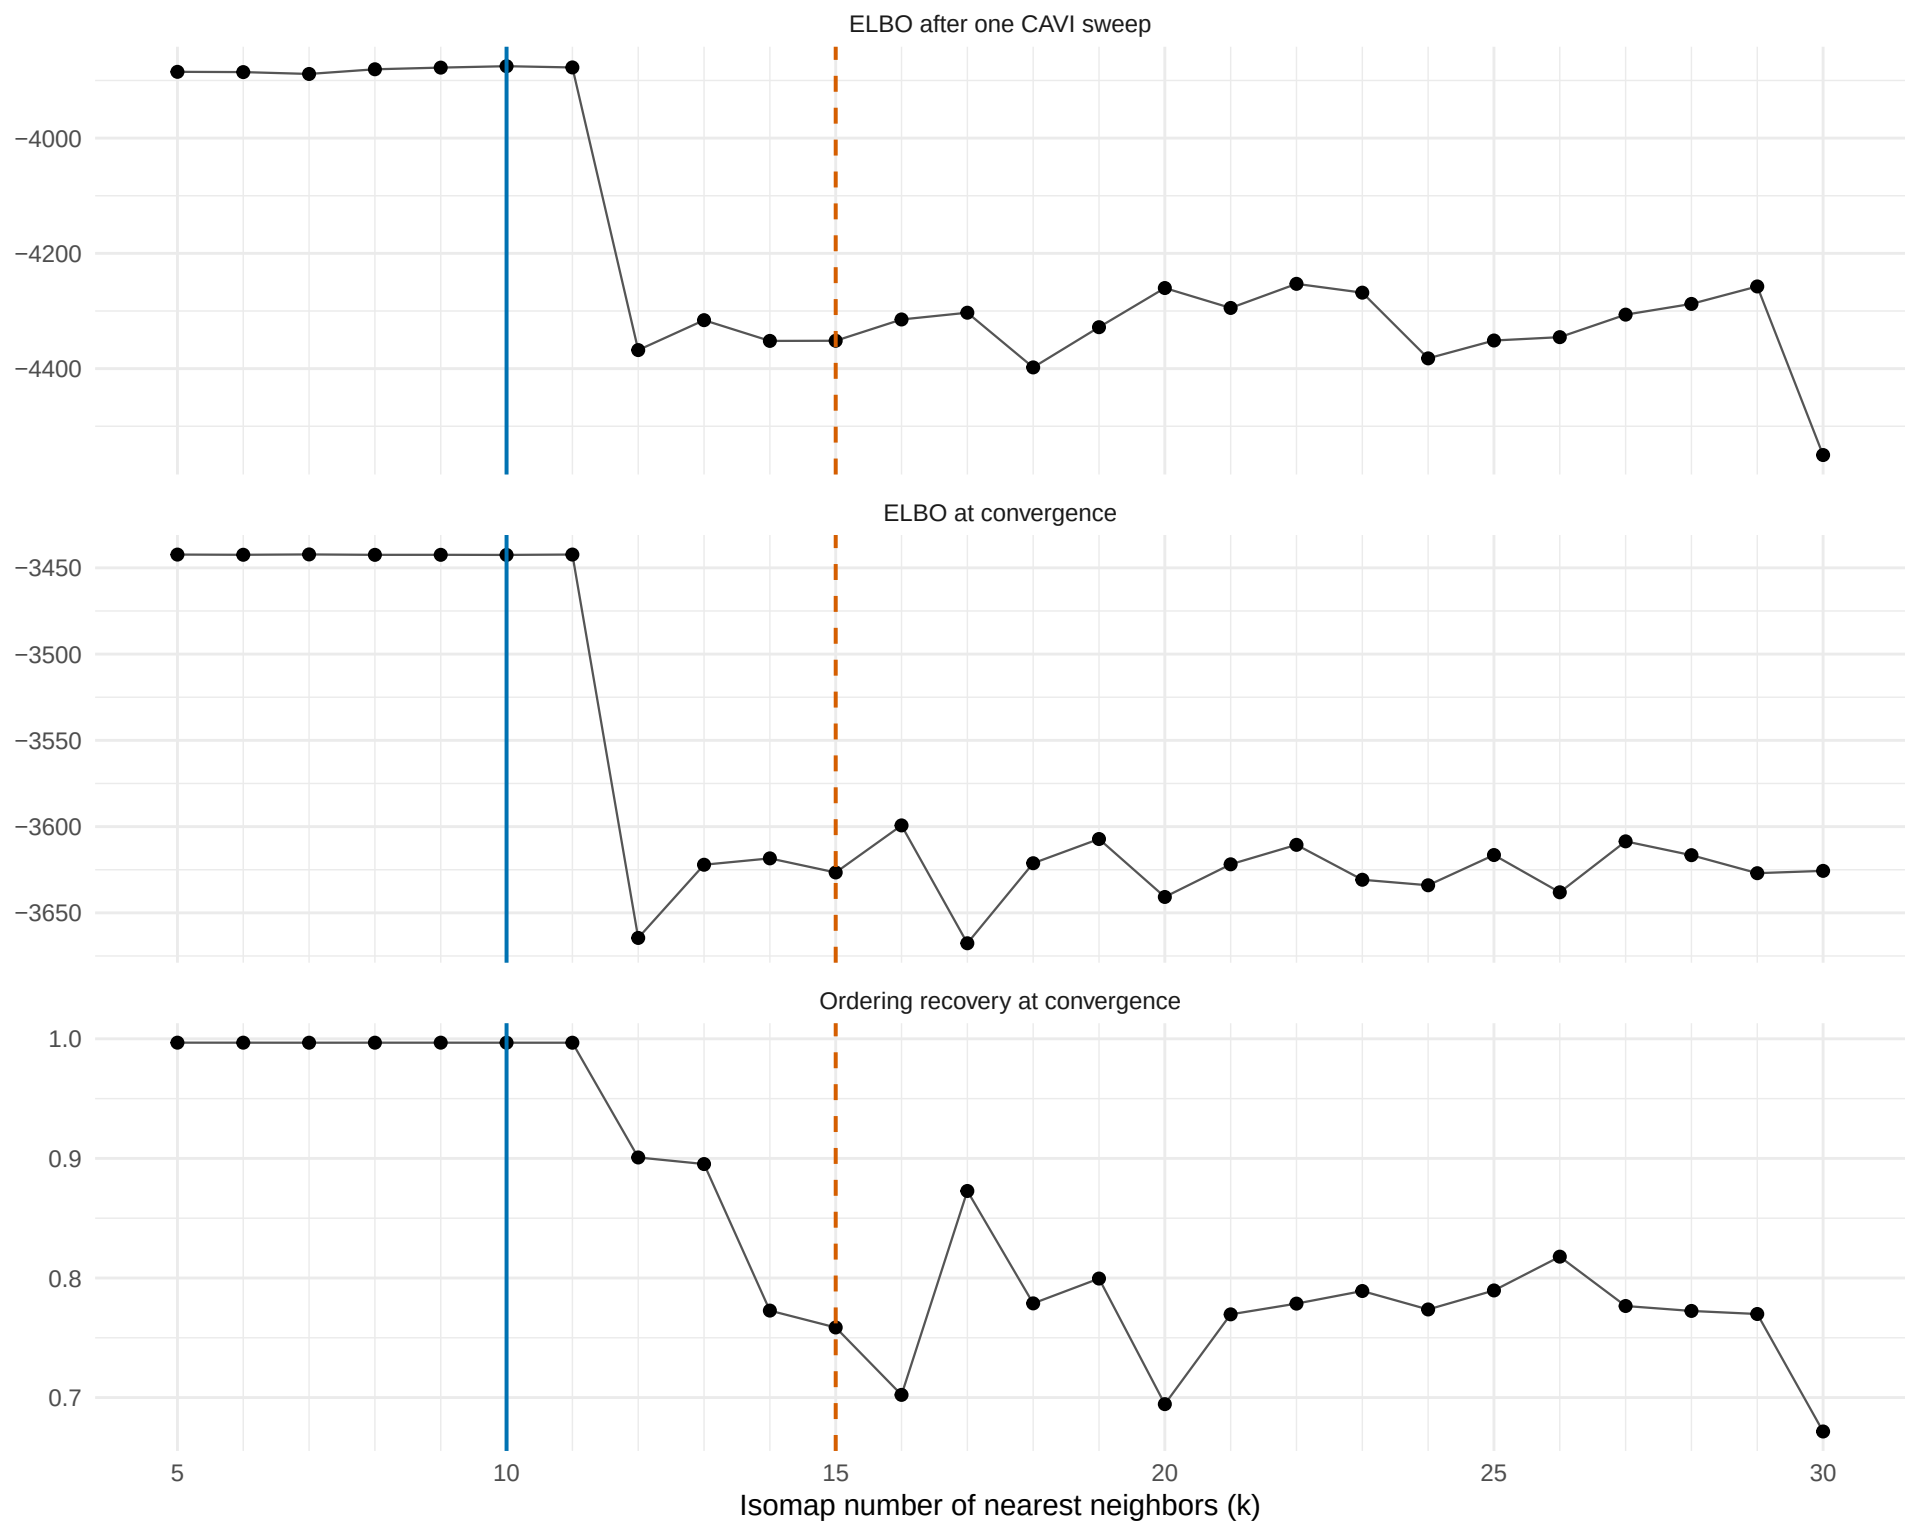

Figure 1. Each point is a neighborhood on the same 300-by-12 observation matrix. ELBO is compared within each fitting stage; higher values are preferred. Recovery is absolute Spearman correlation with true positions. Orange dashed line: k=15 comparator; blue solid line: one-sweep selection.
