

Isomap kNN graphs immediately before and at connectivity

Replicate 6, P=4 | Red edges connect components that are separate in the top row

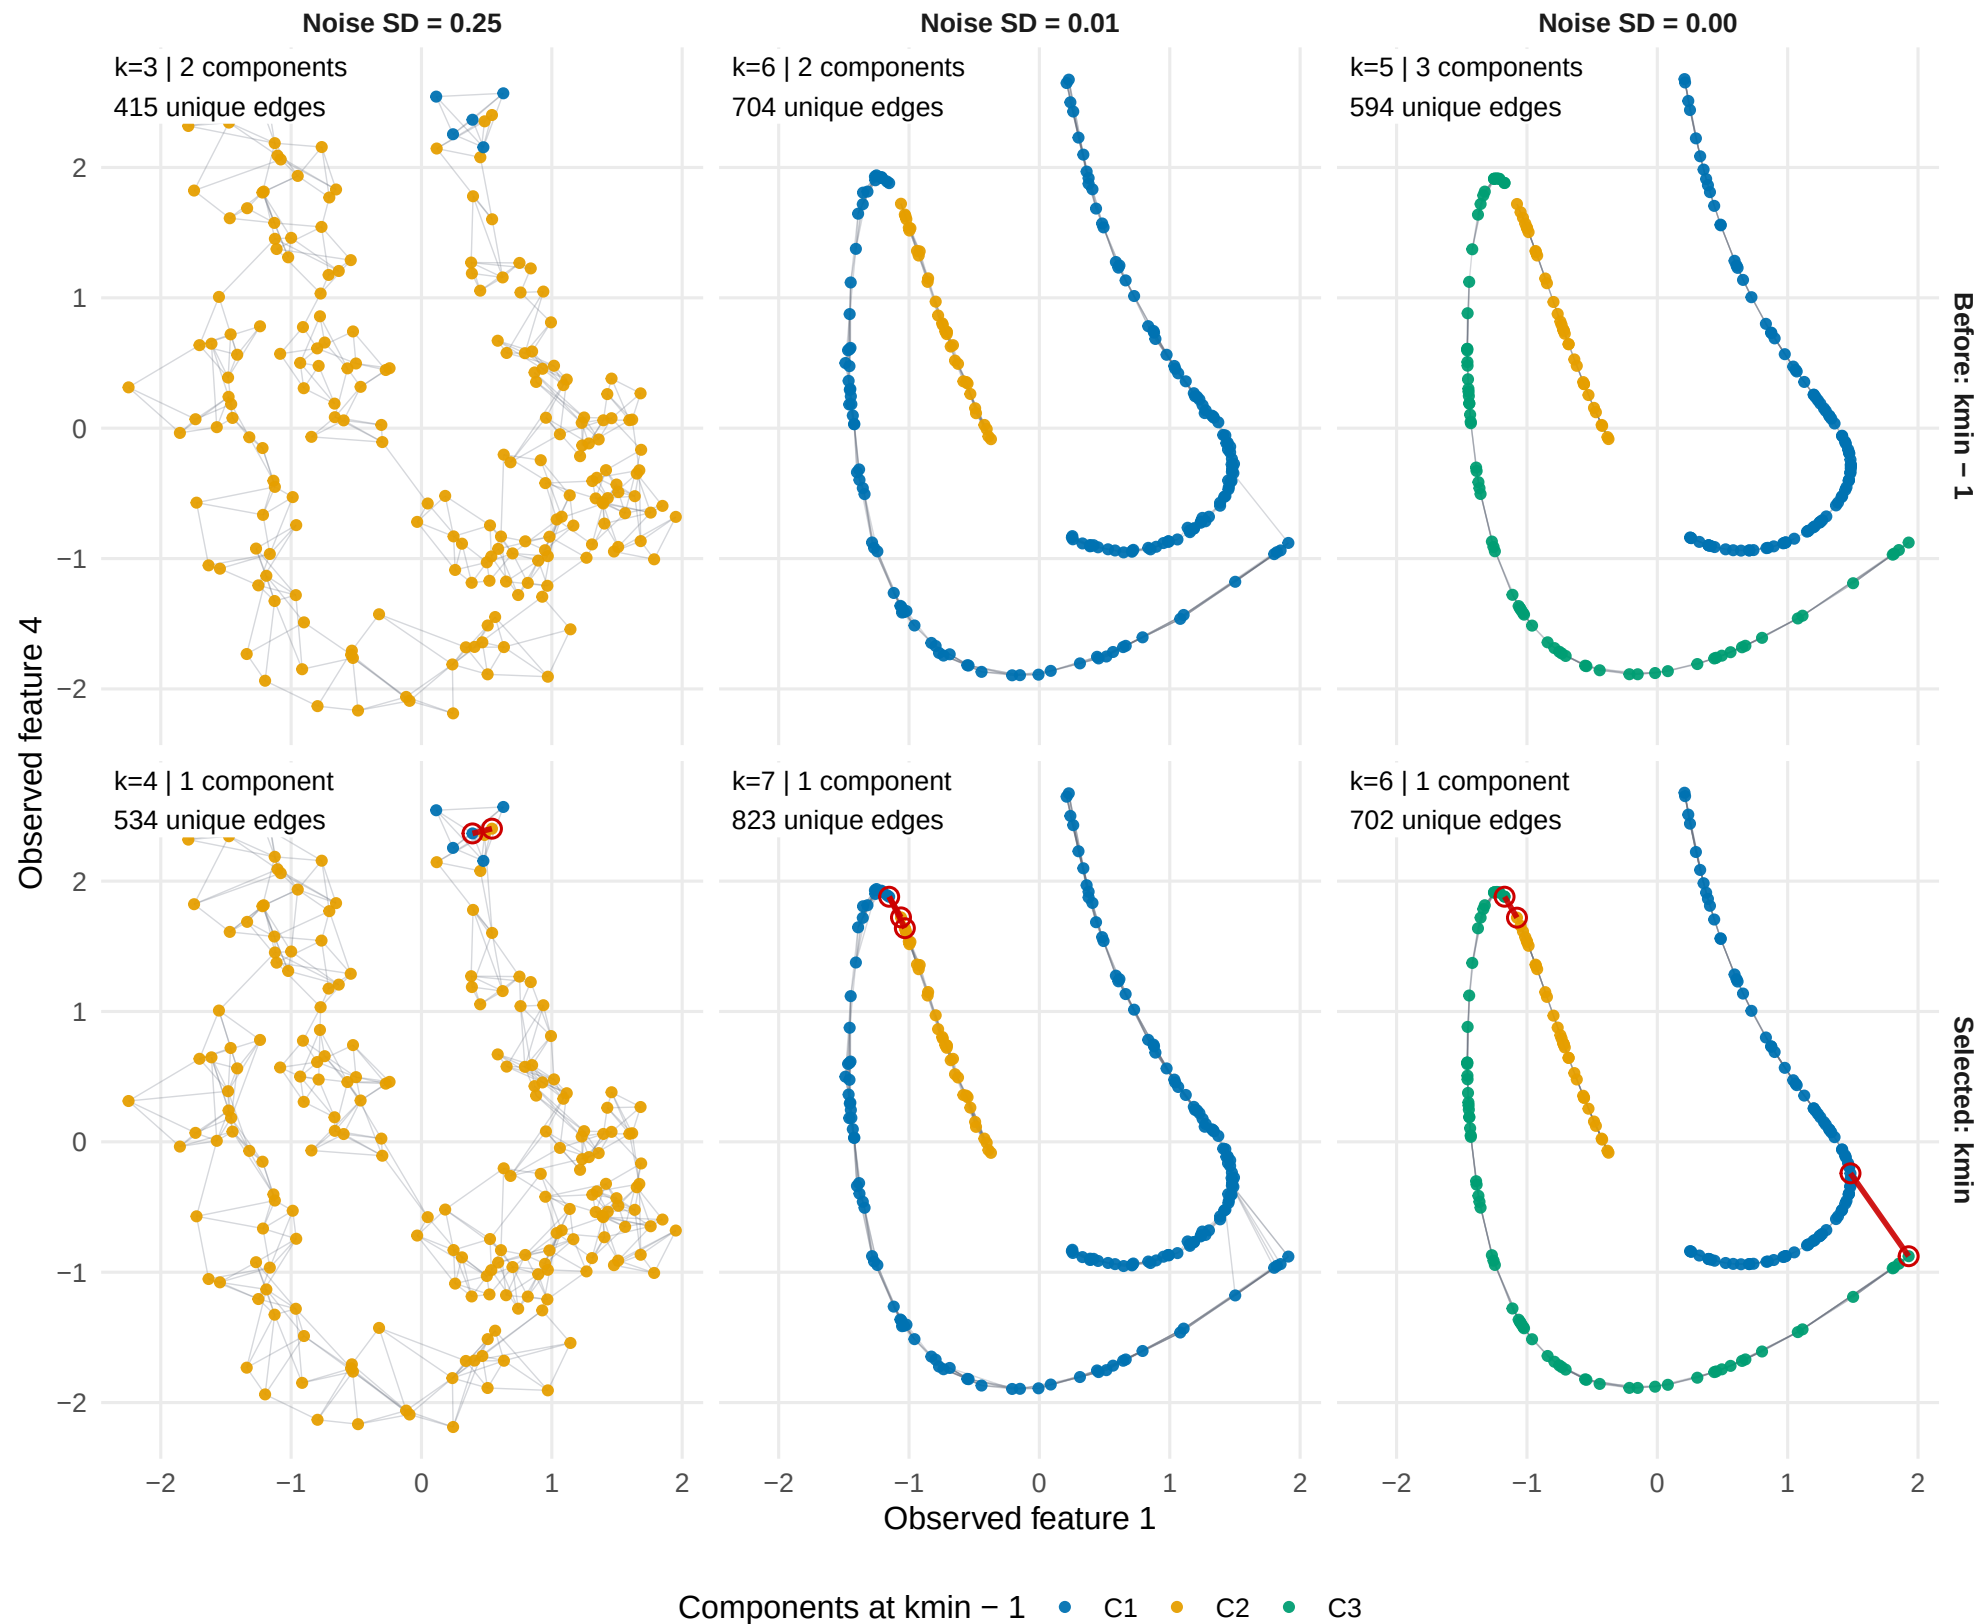

Figure 3. Exact union-kNN graphs: an undirected edge is retained when either sample selects the other. Top: kmin-1; bottom: automatic kmin. All 200 samples and all unique edges are displayed. Nodes retain their top-panel component colors in the bottom panel; component labels restart within each column. Red edges join different top-panel components; red rings mark their endpoints. Edges use four-dimensional distances; the plotted axes are observed features 1 and 4. Projected line crossings do not create graph connections.
