

Which endpoint selects the shortcut?

Each panel shows only the six directed neighbor selections from its marked query

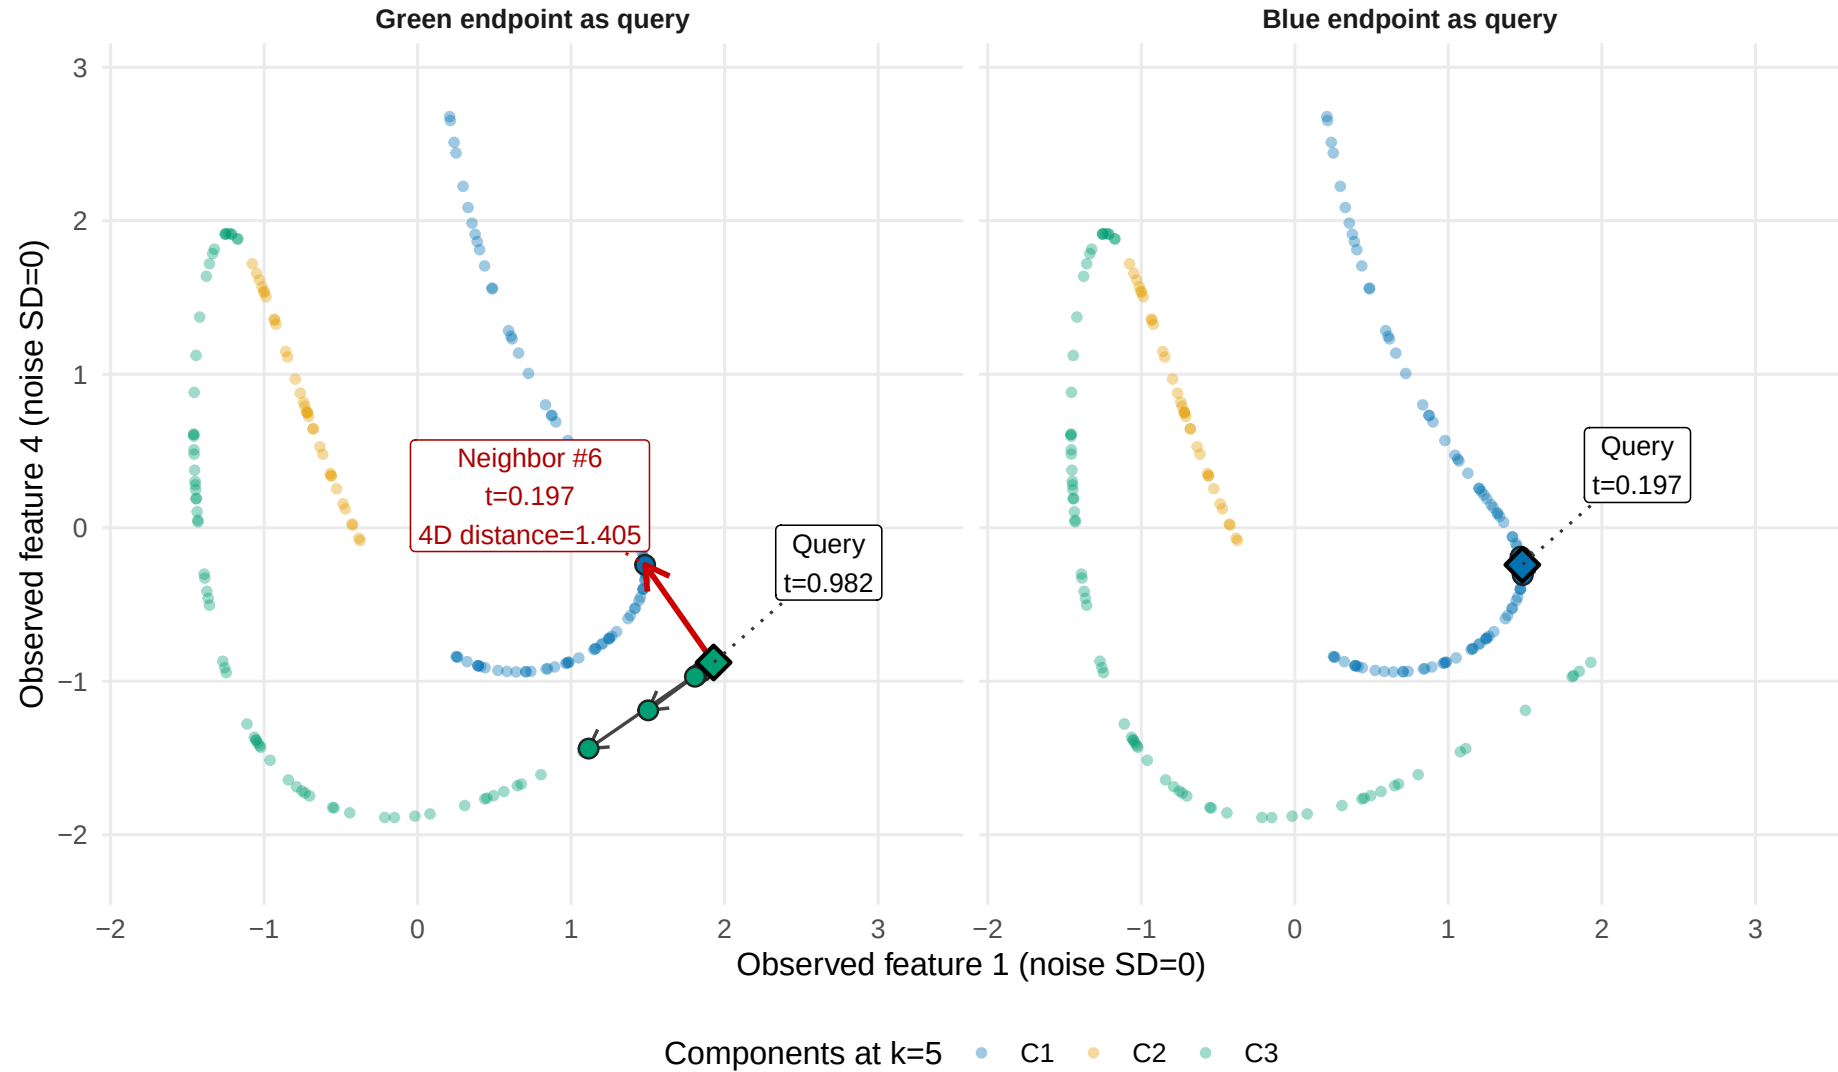

Figure 4. Six nearest neighbors of each endpoint of the noiseless shortcut, computed from all four features. Black diamonds mark queries; arrows point from each query to its selected neighbors. The red arrow is selected by the green endpoint only. Background colors are the k=5 components from Figure 3. The green endpoint has five green neighbors before this blue sixth neighbor; the blue endpoint selects six blue neighbors and ranks the green endpoint 64th. Axes are features 1 and 4.
